Losses. The Table 2 (SEI, 2012) illustrates how an overall derate factor is calculated: The overall derate factor is calculated as the ratio of the actual power to the theoretical power. For a wind turbine, the theoretical power is proportional to the cube of the wind speed. If the wind speed is 18 m/s, the theoretical power is proportional to  $18^3 = 5832$ . If the actual power is 1000, the derate factor is  $1000 / 5832 \approx 0.17$ .
